# On Orthogonal Generalized Derivations of Semiprime Gamma Rings 

Nishteman N. Suliman and Abdul-rhman H. Majeed<br>Salahaddin University: Erbil College of Education, Scientific Departments Department of Mathematics Baghdad University College of Science Department of Mathematics.<br>E-mail: vananesh@gmail.com, ahmajeed@yahoo.com

#### Abstract

The main purpose of this paper is to study and investigate some results concerning orthogonal generalized derivations on a semiprime $\Gamma$-rings, which are related parallel to those earlier obtained on a semiprime rings.

(2000)AMS Subject Classification: 16W25, 16Y30

Keywords: Semiprime - Rings, Derivations, orthogonal Derivations, Generalized Derivations, orthogonal Generalized Derivations.

## Introduction

The notion of a $\Gamma$-ring was first introduced by Nobusawa [7], more general than a ring. The class of $\Gamma$-rings contains not only all rings but also Hestenes ternary rings [6]. W. E. Barnes [3] weakened slightly the conditions in the definition of $\Gamma$-ring in the sense of Nobusawa. After these two authors, many mathematicians made works on $\Gamma$-ring in the sense of Barnes and Nobusawa, which are parallel to the results in the ring theory.

## The gamma ring is defined by Barnes in [3] as follows

A $\Gamma$-ring is a pair $(\mathrm{M}, \Gamma)$ where M and $\Gamma$ are additive abelian groups for which there exists a map from МХГХМ $\rightarrow \mathrm{M}$ (the image of ( $\mathrm{x}, \alpha, \mathrm{y}$ ) was denoted by $\mathrm{x} \alpha \mathrm{y}$ ) for all $x, y z \in M$ and $\alpha \in \Gamma$ satisfying the following conditions:

```
i (x+y)\alphaz = x \alphaz + y dz,
    x(\alpha+\beta)y=x\alphay+x\betay,
    x\alpha(y+z) = x\alphay + x \alphaz,
ii (x\alphay)\betaz=x\alpha(y\betaz),
```

A $\Gamma$-ring M is said to be 2 -torsion free if $2 \mathrm{x}=0$ implies $\mathrm{x}=0$ for $\mathrm{x} \in \mathrm{M} . \mathrm{M}$ is called a prime $\Gamma$ - ring if for any two elements $x, y \in M, x \Gamma M \Gamma y=0$ implies either $x=$ 0 or $y=0$, and $M$ is called a semiprime if $x \Gamma М Г x=0$ with $x \in M$ implies $x=0$. Note that every prime $\Gamma$-ring is semiprime.

Note that the notion of derivation of $\Gamma$-ring has been introduced by M. Sapanci and A.Nakajima in [8], where the concept of generalized derivation of a $\Gamma$-ring has been introduced by Y.Ceven and M.A.Öztürk in [5]. Let M be a $\Gamma$-ring and let d: M $\rightarrow \mathrm{M}$ be additive map. Then d is called a derivation if
$d(x \alpha y)=d(x) \alpha y+x \alpha d(y)$ for all $x, y \in M$ and $\alpha \in \Gamma$.
Furthmore, an additive map $G: M \rightarrow M$ is called a generalized derivation if there exists a derivation $d: M \rightarrow M$ such that $G(x \alpha y)=G(x) \alpha y+x \alpha d(y)$ for all $x, y \in M$ and $\alpha \in \Gamma$.

Two mappings f and $g$ of a $\Gamma$-ring $M$ are said to be orthogonal on $M$ if $f(x) \Gamma M \Gamma g(y)=0=g(y) \Gamma M \Gamma f(x)$ for all $x, y \in M$ and $\alpha \in \Gamma$.

In [4], Bers ar and Vukman introduced the notion of orthogonality for a pair of derivations (d, g) of a semiprime ring. In [2] M. Ashraf and M. Jamal introduced the notion of orthogonality for a pair of derivations ( $\mathrm{d}, \mathrm{g}$ ) of a semiprime $\Gamma$-ring and give several necessary and sufficient conditions for $d$ and $g$ to be orthogonal. In [1] N . Argac , A. Nakajima and E. Albas extended the results of [4] to orthogonality for a pair of generalized derivations ( $\mathrm{D}, \mathrm{d}$ ) and ( $\mathrm{G}, \mathrm{g}$ ), and gave some necessary and sufficient conditions for ( $\mathrm{D}, \mathrm{d}$ ) and ( $\mathrm{G}, \mathrm{g}$ ) to be orthogonal.

In this paper, we study the concept of orthogonal generalized derivations in $\Gamma$ ring, and obtain some results parallel to those obtained by [1].

Throughout this paper, the condition $x \alpha y \beta z=x \beta y \alpha z$, for all $x, y, z \in M$ and $\alpha, \beta \in$ $\Gamma$ will be represented by $\left({ }^{*}\right)$.

## Preliminaries

For proving the main results, we have needed some important lemmas. So we start as follows

Definition 2.1: Let $M$ be a $\Gamma$-ring. Two generalized derivations $D$ and $G$ of $M$ associated with two derivations $d$ and $g$ of $M$, respectively are said to be orthogonal if $D(x) \Gamma M \Gamma G(y)=0=G(y) \Gamma M \Gamma D(x)$ for all $x, y \in M$.

Example 2.2: Let $\left(\mathrm{M}_{1}, \Gamma_{1}\right)$ and $\left(\mathrm{M}_{2}, \Gamma_{2}\right)$ be prime gamma-rings. Let M be the direct product of $\mathrm{M}_{1} \& \mathrm{M}_{2}$ and $\Gamma$ be the direct product of $\Gamma_{1} \& \Gamma_{2}$. Then it can be easily verified that $(M, \Gamma)$ is a semiprime gamma-ring which is a direct sum of $\left(M_{1}, \Gamma_{1}\right)$ and $\left(\mathrm{M}_{2}, \Gamma_{2}\right)$.

Let $d_{1}$ and $g_{2}$ be a nonzero derivations of $M_{1}$ and $M_{2}$, respectively and $M=$ $M_{1} \oplus M_{2}$. Then the maps $d$ and $g$ on the $\Gamma$-ring $M$ which are defined by $d((x, y))=\left(d_{1}(x), 0\right)$ and $g(x, y)=\left(0, g_{2}(x)\right)$ for all $x, y \in M$
are derivations of M. Moreover, if $\left(D_{1}, d_{1}\right)$ and $\left(G_{2}, g_{2}\right)$ are generalized derivations of $M_{1}$ and $M_{2}$ respectively. Defining
$D((x, y))=\left(D_{1}(x), 0\right)$ and $G(x, y)=\left(0, G_{2}(x)\right)$ for all $x, y \in M$,
We see that ( $D, d$ ) and ( $G, g$ ) are generalized derivations of $M$ such that ( $D, d$ ) and $(\mathrm{G}, \mathrm{g})$ are orthogonal.

Lemma 2.3. (2, Lemma 2.2]): Let M be a 2 -torsion free semiprime $\Gamma$-ring and $\mathrm{x}, \mathrm{y}$ the elements of M . Then the following conditions are equivalent:
(i) $\mathrm{x} \alpha \mathrm{M} \beta \mathrm{y}=(0)$ for all $\alpha, \beta \in \Gamma$.
(ii) $y \alpha M \beta x=(0)$ for all $\alpha, \beta \in \Gamma$.
(iii) $x \alpha M \beta y+y \alpha M \beta x=(0)$ for all $\alpha, \beta \in \Gamma$.

If one of these conditions are fulfilled then $\mathrm{x} \gamma \mathrm{y}=\mathrm{y} \gamma \mathrm{x}=0$ for all $\gamma \in \Gamma$.
Lemma 2.4. ([2, Lemma 2.4]): Let M be a 2-torsion free semiprime $\Gamma$-ring and let d and $g$ be derivations of $M$. Derivations $d$ and $g$ are orthogonal if and only if $d(x) \alpha g(y)$ $+g(x) \alpha d(y)=0$ for all $x, y \in M$ and $\alpha \in \Gamma$.

## Main Results

## To prove the main result we need the following lemma

Lemma 3.1: Let $M$ be a 2 -torsion free semiprime $\Gamma$-ring. Suppose that $D$ and $G$ are a generalized derivations of $M$ associated with derivations $d$ and $g$ resp. of $M$. If $D$ and $G$ are orthogonal, then for all $x, y \in M$ and $\alpha \in \Gamma$, the following relations are holds $\mathrm{D}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=\mathrm{G}(\mathrm{x}) \alpha \mathrm{D}(\mathrm{y})=0$, hence $\mathrm{D}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})+\mathrm{G}(\mathrm{x}) \alpha \mathrm{D}(\mathrm{y})=0$.
(ii) d and G are orthogonal and $\mathrm{d}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=\mathrm{G}(\mathrm{y}) \alpha \mathrm{d}(\mathrm{x})=0$.
(iv) g and D are orthogonal and $\mathrm{g}(\mathrm{x}) \alpha \mathrm{D}(\mathrm{y})=\mathrm{D}(\mathrm{y}) \alpha \mathrm{g}(\mathrm{x})=0$.
(iv) d and g are orthogonal and this implies $\mathrm{d}(\mathrm{x}) \operatorname{\alpha g}(\mathrm{y})=0$.
(v) $\mathrm{dG}=\mathrm{Gd}=0$ and $\mathrm{gD}=\mathrm{Dg}=0$.
(vi) $\mathrm{DG}=\mathrm{GD}=0$.

Proof. (i) Since D and G are orthogonal generalized derivation of M. Then we have $\mathrm{D}(\mathrm{x}) \alpha \mathrm{m} \beta \mathrm{G}(\mathrm{y})=0=\mathrm{G}(\mathrm{y}) \alpha \mathrm{m} \beta \mathrm{D}(\mathrm{x})$ for all $\mathrm{x}, \mathrm{y}, \mathrm{m} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.

Hence by Lemma (2.3) we get
$\mathrm{D}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=0=\mathrm{G}(\mathrm{x}) \alpha \mathrm{D}(\mathrm{y})$ and $\mathrm{D}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})+\mathrm{G}(\mathrm{x}) \alpha \mathrm{D}(\mathrm{y})=0$ for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha, \beta \in$ $\Gamma$.
(ii) Since D and G are orthogonal generalized derivations of M . Then we have $\mathrm{D}(\mathrm{x}) \alpha \mathrm{m} \beta \mathrm{G}(\mathrm{y})=0$ for for all $\mathrm{x}, \mathrm{y}, \mathrm{m} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.

By Lemma (2.3) we have
$D(x) \alpha G(y)=0$ for for all $x, y \in M$ and $\alpha \in \Gamma$.

Replacing $x$ by $z \gamma x$ in (2), we obtain
$\mathrm{D}(\mathrm{z}) \gamma \mathrm{x} \alpha \mathrm{G}(\mathrm{y})+\mathrm{z} \mathrm{\gamma} \mathrm{~d}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \gamma \in \Gamma$
Using (1) in (3) we get
$\mathrm{z} \gamma \mathrm{d}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=0$ for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$, and $\alpha, \gamma \in \Gamma$.
By semiprimeness of M it follows that $\mathrm{d}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=0$. Thus d and G are orthogonal. Replacing $x$ by $x \beta m$ we obtain
$0=\mathrm{d}(\mathrm{x}) \beta \mathrm{m} \alpha \mathrm{G}(\mathrm{y})+\mathrm{x} \beta \mathrm{d}(\mathrm{m}) \alpha \mathrm{G}(\mathrm{y})=\mathrm{d}(\mathrm{x}) \beta \mathrm{m} \alpha \mathrm{G}(\mathrm{y})$ for all $\mathrm{x}, \mathrm{y}, \mathrm{m} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.
Therefore by Lemma (2.3) we obtain $\mathrm{G}(\mathrm{y}) \alpha \mathrm{d}(\mathrm{x})=0$ for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$.
That is $\mathrm{d}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=\mathrm{G}(\mathrm{y}) \alpha \mathrm{d}(\mathrm{x})=0$
(iii) The proof is similar to (ii).
(iv) Since $D$ and $G$ are orthogonal generalized derivations of $M$. Then we have $\mathrm{D}(\mathrm{x}) \alpha \mathrm{m} \beta \mathrm{G}(\mathrm{y})=0=\mathrm{G}(\mathrm{y}) \alpha \mathrm{m} \beta \mathrm{D}(\mathrm{x})$ for all $\mathrm{x}, \mathrm{y}, \mathrm{m} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.

By Lemma(2.3) we get
$\mathrm{D}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=0$ for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$.
Replacing $x$ by $x \gamma z$ in (5) and using (4), we get
$x \gamma d(z) \alpha G(y)=0$ for all $x, y, z \in M$ and $\alpha, \gamma \in \Gamma$.
Now replacing y by syy in (5) and using (4), we get
$\mathrm{x} \gamma \mathrm{d}(\mathrm{z}) \alpha \operatorname{sig}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z}, \mathrm{s} \in \mathrm{M}$ and $\alpha, \gamma \in \Gamma$.
By semiprimeness we obtain $\mathrm{d}(\mathrm{z}) \alpha \boldsymbol{\alpha} \gamma \mathrm{g}(\mathrm{y})=0$ for all $\mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta, \gamma \in \Gamma$.
Then $d$ and $g$ are orthogonal and by Lemma (2.3) we have $d(z) \alpha g(y)=0$, In particular $\mathrm{d}(\mathrm{x}) \alpha \mathrm{g}(\mathrm{y})=0$.
(v) Using (ii) since d and G are orthogonal, then we have
$\mathrm{d}(\mathrm{x}) \alpha \mathrm{z} \beta \mathrm{G}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.
Hence
$0=\mathrm{G}(\mathrm{d}(\mathrm{x}) \alpha z \beta \mathrm{G}(\mathrm{y}))$
$=\mathrm{G}(\mathrm{d}(\mathrm{x})) \alpha z \beta \mathrm{G}(\mathrm{y})+\mathrm{d}(\mathrm{x}) \alpha \mathrm{g}(\mathrm{z}) \beta \mathrm{G}(\mathrm{y})+\mathrm{d}(\mathrm{x}) \alpha z \beta \mathrm{~g}(\mathrm{G}(\mathrm{y}))$ for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in$
$\Gamma$.
Since $d$ and $g$ are orthogonal, we get
$\mathrm{G}(\mathrm{d}(\mathrm{x})) \alpha z \beta \mathrm{G}(\mathrm{y})=0$ for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.
Replacing y by $\mathrm{d}(\mathrm{x})$ in (9) and using semiprimeness of M we obtain $\mathrm{G}(\mathrm{d}(\mathrm{x}))=0$, for all $x \in M$.
Similarly we can get $\mathrm{dG}=0, \mathrm{gD}=0$, and $\mathrm{Dg}=0$.
(iv) Since D and G are orthogonal we have
$\mathrm{D}(\mathrm{x}) \alpha \mathrm{m} \beta \mathrm{G}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{m} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.
Hence
$0=\mathrm{G}(\mathrm{D}(\mathrm{x}) \alpha \mathrm{m} \beta \mathrm{G}(\mathrm{y}))$
$=\mathrm{G}(\mathrm{D}(\mathrm{x})) \alpha \mathrm{m} \beta \mathrm{G}(\mathrm{y})+\mathrm{D}(\mathrm{x}) \alpha \mathrm{g}(\mathrm{m} \beta \mathrm{G}(\mathrm{y}))$, for all $\mathrm{x}, \mathrm{y}, \mathrm{m} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.
By (iii) D and g are orthogonal, we get
$\mathrm{G}(\mathrm{D}(\mathrm{x})) \alpha \mathrm{m} \beta \mathrm{G}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{m} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.
Replacing y by $D(x)$ and using semiprimeness of $M$ we obtain $G(D(x))=0$, for all $x \in$ M.

Similarly we show that $\mathrm{DG}=0$.
Remark 3.2: If $M$ is a 2-torsion free prime or semiprime $\Gamma$-ring, and ( $D, d$ ),( $\mathrm{G}, \mathrm{g}$ ) are generalized derivations of M. If (DG, dg ) is a generalized derivation, then ( $\mathrm{D}, \mathrm{d}$ ) and ( $\mathrm{G}, \mathrm{g}$ ) are not orthogonal.

Example 3.3: Let $a$ and $b$ be two nonzero elements of $M$ such that $a \alpha b=0, D(x)=$ $\mathrm{a} \alpha \mathrm{x}$, and $\mathrm{G}(\mathrm{x})=\mathrm{b} \beta \mathrm{x}$ for all $\mathrm{x} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$. Then $(\mathrm{D}, 0)$ and ( $\mathrm{G}, 0$ ) are nonzero generalized derivations such that ( $\mathrm{DG}, 0$ ) is generalized derivation.

Now we show that $D$ and $G$ are not orthogonal. If ( $\mathrm{D}, 0$ ) and ( $\mathrm{G}, 0$ ) are orthogonal, then by Lemma 3.1 (i) we have $\mathrm{D}(\mathrm{x}) \gamma \mathrm{G}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\gamma \in \Gamma$. Then we have
$a \alpha x \gamma b \beta y=0$, for all $x, y \in M$ and $\alpha, \beta, \gamma \in \Gamma$.
If M is prime $\Gamma$-ring then the relation (10) implies that $\mathrm{a}=0$ or $\mathrm{b}=0$ and this is contradiction, and if M is semiprime $\Gamma$-ring, then taking $\mathrm{a}=\mathrm{b}$ and then the relation (10) implies that $\mathrm{a}=0$ and this is also contradiction. Hence D and G are not orthogonal. Then there exists non-orthogonal generalized derivation (D, d) and (G, g) such that ( $\mathrm{DG}, \mathrm{dg}$ ) is a generalized derivation

We now to prove our main result
Theorem 3.4: Let $M$ be a 2-torsion free semiprime $\Gamma$-ring, and ( $D, d$ ), ( $G, g$ ) are generalized derivations of M . Then the following conditions are equivalent: D and G are orthogonal.
(ii) For all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$, the following relations hold:
(a) $\mathrm{D}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})+\mathrm{G}(\mathrm{x}) \alpha \mathrm{D}(\mathrm{y})=0$,
(b) $\mathrm{d}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})+\mathrm{g}(\mathrm{x}) \alpha \mathrm{D}(\mathrm{y})=0$.
(iii) $D(x) \alpha G(y)=d(x) \alpha G(y)=0$ for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$.
(iv) $\mathrm{D}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=0$ for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}, \alpha \in \Gamma$ and $\mathrm{dG}=\mathrm{dg}=0$.
(v) DG is a generalized derivation of $M$ associated with derivation dg of M and $\mathrm{D}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=0$ for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$.

Proof: (i) $\rightarrow$ (ii) are proved by Lemma 3.1.
(ii) $\rightarrow$ (iii) We have $\mathrm{D}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})+\mathrm{G}(\mathrm{x}) \alpha \mathrm{D}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$.

Replacing x by $\mathrm{y} \beta \mathrm{x}$, we get
$\mathrm{D}(\mathrm{y}) \beta \mathrm{x} \alpha \mathrm{G}(\mathrm{y})+\mathrm{y} \beta \mathrm{d}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})+\mathrm{G}(\mathrm{y}) \beta \mathrm{x} \alpha \mathrm{D}(\mathrm{y})+\mathrm{y} \beta \mathrm{g}(\mathrm{x}) \alpha \mathrm{D}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha$, $\beta \in \Gamma$.

By (ii)(b) we obtain
$\mathrm{D}(\mathrm{y}) \beta \mathrm{x} \alpha \mathrm{G}(\mathrm{y})+\mathrm{G}(\mathrm{y}) \beta \mathrm{x} \alpha \mathrm{D}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.
By Lemma 2.3 and Lemma (2.2) we get
$\mathrm{D}(\mathrm{x}) \beta \mathrm{x} \alpha \mathrm{G}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$
and so is
$\mathrm{D}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$.
Replacing $x$ by $z \beta x$ in (12), we get
$D(z) \beta x \alpha G(y)+z \beta d(x) \alpha G(y)=0$, for all $x, y \in M$ and $\alpha, \beta \in \Gamma$
By using (12) in (13) we obtain
$z \beta d(x) \alpha G(y)=0$, for all $x, y, z \in M$ and $\alpha, \beta \in \Gamma$.
By semiprimeness, we obtain $\mathrm{d}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=0$.
(iii) $\rightarrow$ (iv) we have $\mathrm{D}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=\mathrm{d}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$.

Replacing $x$ by $x \beta z$, and using (iii) we have
$\mathrm{d}(\mathrm{x}) \beta z \alpha \mathrm{G}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.
From (13)
$0=\mathrm{d}(\mathrm{d}(\mathrm{x}) \beta \mathrm{z} \alpha \mathrm{G}(\mathrm{y}))$
$=\mathrm{d}(\mathrm{d}(\mathrm{x}) \beta \mathrm{z} \alpha \mathrm{G}(\mathrm{y})+\mathrm{d}(\mathrm{x}) \beta \mathrm{d}(\mathrm{z}) \alpha \mathrm{G}(\mathrm{y})+\mathrm{d}(\mathrm{x}) \beta z \alpha \mathrm{~d}(\mathrm{G}(\mathrm{y}))$ for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.
Therefore, by using (15) and (iii), we obtain $\mathrm{d}(\mathrm{x}) \beta \mathrm{z} \alpha \mathrm{d}(\mathrm{G}(\mathrm{y}))=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.

Replacing $x$ by $G(y)$, and using semiprimeness of $M$ we get $d(G(y))=0$ for all $y \in M$.
Also by (iii) we have $\mathrm{d}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=0$. Replacing y by $\mathrm{y} \beta \mathrm{z}$, and using (iii) we get
$\mathrm{d}(\mathrm{x}) \alpha y \beta \mathrm{~g}(\mathrm{z})=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.
Now we have $\mathrm{d}(\mathrm{d}(\mathrm{x}) \alpha \mathrm{y} \beta \mathrm{g}(\mathrm{z}))=0$,
Hence it follows that
$0=\mathrm{d}(\mathrm{d}(\mathrm{x})) \alpha \mathrm{y} \beta \mathrm{g}(\mathrm{z})+\mathrm{d}(\mathrm{x}) \alpha \mathrm{d}(\mathrm{y} \beta \mathrm{g}(\mathrm{z}))$
$=\mathrm{d}(\mathrm{d}(\mathrm{x})) \alpha \mathrm{y} \beta \mathrm{g}(\mathrm{z})+\mathrm{d}(\mathrm{x}) \alpha \mathrm{d}(\mathrm{y}) \beta \mathrm{g}(\mathrm{z}))+\mathrm{d}(\mathrm{x}) \alpha \mathrm{y} \beta \mathrm{d}(\mathrm{g}(\mathrm{z}))$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in$
$\Gamma$.

Therefore by using (16) and (iii) we obtain
$\mathrm{d}(\mathrm{x}) \alpha y \beta \mathrm{~d}(\mathrm{~g}(\mathrm{z}))=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.
Replacing x by $\mathrm{g}(\mathrm{z})$, and using semiprimeness of M we get $\mathrm{d}(\mathrm{g}(\mathrm{z}))=0$, for all $\mathrm{z} \in$
M.
(iv) $\rightarrow$ (v) We have $\mathrm{D}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=0$. for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$.

Replacing y by y $\beta z$, and using (iv) we get
$\mathrm{D}(\mathrm{x}) \alpha y \beta \mathrm{~g}(\mathrm{z})=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.
By Lemma 2.3 we obtain
$\mathrm{D}(\mathrm{x}) \alpha \mathrm{g}(\mathrm{z})=0$, for all $\mathrm{x}, \mathrm{z} \in \mathrm{M}$ and $\alpha \in \Gamma$
By (iv) we have $d G(x)=\operatorname{dg}(x)=0$, for all $x \in M$.
Replacing x by $\mathrm{x} \alpha \mathrm{y}$, we get
$d G(x \alpha y)=\operatorname{dg}(x \alpha y)=0$
$\mathrm{d}(\mathrm{G}(\mathrm{x}) \alpha \mathrm{y}+\mathrm{x} \alpha \mathrm{g}(\mathrm{y}))=\mathrm{d}(\mathrm{g}(\mathrm{x}) \alpha \mathrm{y}+\mathrm{x} \alpha \mathrm{g}(\mathrm{y}))=0$
$d(\mathrm{G}(\mathrm{x})) \alpha \mathrm{y}+\mathrm{G}(\mathrm{x}) \alpha \mathrm{d}(\mathrm{y})+\mathrm{d}(\mathrm{x}) \alpha \mathrm{g}(\mathrm{y})+\mathrm{x} \alpha \mathrm{d}(\mathrm{g}(\mathrm{y}))=\mathrm{d}(\mathrm{g}(\mathrm{x})) \alpha \mathrm{y}+\mathrm{g}(\mathrm{x}) \alpha \mathrm{d}(\mathrm{y})+\mathrm{d}(\mathrm{x}) \alpha \mathrm{g}(\mathrm{y})+\mathrm{x} \alpha \mathrm{d}(\mathrm{g}(\mathrm{y}$ ))

Hence it follows that
$\mathrm{G}(\mathrm{x}) \alpha \mathrm{d}(\mathrm{y})=\mathrm{g}(\mathrm{x}) \alpha \mathrm{d}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.
Now we take
$D G(x \alpha y)=D G(x) \alpha y+G(x) \alpha d(y)+D(x) \alpha g(y)+x \alpha d g(y)$, for all $x, y, z \in M$ and $\alpha, \beta \in$ $\Gamma$.

Using (17) and (18) we get
$D G(x \alpha y)=D G(x) \alpha y+x \alpha \operatorname{dg}(y)$, for all $x, y, z \in M$ and $\alpha, \beta \in \Gamma$.
(iii) $\rightarrow$ (i) since $\mathrm{D}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=\mathrm{d}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$. Replacing x by $x \beta z$ we get
$0=\mathrm{D}(\mathrm{x}) \beta \mathrm{z} \alpha \mathrm{G}(\mathrm{y})+\mathrm{x} \beta \mathrm{d}(\mathrm{z}) \alpha \mathrm{G}(\mathrm{y})=\mathrm{D}(\mathrm{x}) \beta z \alpha \mathrm{G}(\mathrm{y})$, this implies that D and G are orthogonal.
(v) $\rightarrow$ (i) By hypothesis we have
$\operatorname{DG}(x \alpha y)=\operatorname{DG}(x) \alpha y+x \alpha \operatorname{dg}(y)$, for all $x, y, z \in M$ and $\alpha, \beta \in \Gamma$.
In other hand we have
$\mathrm{DG}(\mathrm{x} \alpha \mathrm{y})=\mathrm{DG}(\mathrm{x}) \alpha \mathrm{y}+\mathrm{G}(\mathrm{x}) \alpha \mathrm{d}(\mathrm{y})+\mathrm{D}(\mathrm{x}) \alpha \mathrm{g}(\mathrm{y})+\mathrm{x} \alpha \mathrm{dg}(\mathrm{y})$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.
Comparing (19) and (20) we get
$\mathrm{G}(\mathrm{x}) \alpha \mathrm{d}(\mathrm{y})+\mathrm{D}(\mathrm{x}) \alpha \mathrm{g}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$.
Since $\mathrm{D}(\mathrm{x}) \alpha \mathrm{G}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$, replacing x by $\mathrm{y} \beta \mathrm{z}$ we get $0=\mathrm{D}(\mathrm{x}) \beta \mathrm{G}(\mathrm{y}) \beta \mathrm{z}+\mathrm{D}(\mathrm{x}) \alpha \mathrm{y} \beta \mathrm{g}(\mathrm{z})=\mathrm{D}(\mathrm{x}) \alpha \mathrm{y} \beta \mathrm{g}(\mathrm{z})$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$

By Lemma (2.3) we obtain $g(z) \alpha \mathrm{D}(\mathrm{x})=0$, for all $\mathrm{x}, \mathrm{z} \in \mathrm{M}$ and $\alpha \in \Gamma$. Replacing z by $\mathrm{y} \beta \mathrm{z}$, we get
$\mathrm{g}(\mathrm{y}) \beta \mathrm{z} \alpha \mathrm{D}(\mathrm{x})=0$ for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.

By Lemma (2.3) we obtain $\mathrm{D}(\mathrm{x}) \alpha \mathrm{g}(\mathrm{y})=0$.
Now The relation (21) we get $G(x) \alpha d(y)=0$ for all $x, y \in M$ and $\alpha \in \Gamma$. Hence by Lemma(2.3) we have $\mathrm{d}(\mathrm{y}) \alpha \mathrm{G}(\mathrm{x})=0$ for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$, therefore by (iii) we get D and G are orthogonal.

Theorem 3.5: Let M be a 2-torsion free semiprime $\Gamma$-ring satisfying (*), and ( $\mathrm{D}, \mathrm{d}$ ) and ( $\mathrm{G}, \mathrm{g}$ ) be generalized derivations of M . Then the following conditions are equivalent:

DG is a generalized derivation associated with derivation dg of M .
(ii) GD is a generalized derivation associated with derivation gd of M .
(iii) D and g are orthogonal, and G and d are orthogonal.

Proof. (i) $\rightarrow$ (iii) since DG is a generalized derivation associated with derivation dg of $M$, that is
$\operatorname{DG}(\mathrm{x} \alpha \mathrm{y})=\mathrm{DG}(\mathrm{x}) \alpha \mathrm{y}+\mathrm{x} \alpha \mathrm{dg}(\mathrm{y})$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$
In other hand we have
$\mathrm{DG}(\mathrm{x} \alpha \mathrm{y})=\mathrm{DG}(\mathrm{x}) \alpha \mathrm{y}+\mathrm{G}(\mathrm{x}) \alpha \mathrm{d}(\mathrm{y})+\mathrm{D}(\mathrm{x}) \operatorname{\alpha g}(\mathrm{y})+\mathrm{x} \alpha \mathrm{dg}(\mathrm{y})$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$.
Comparing (22) and (23) we get
$\mathrm{G}(\mathrm{x}) \alpha \mathrm{d}(\mathrm{y})+\mathrm{D}(\mathrm{x}) \alpha \mathrm{g}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$.
Since $d g$ is derivation then we have
$\operatorname{dg}(\mathrm{x} \alpha \mathrm{y})=\operatorname{dg}(\mathrm{x}) \alpha \mathrm{y}+\mathrm{x} \alpha \mathrm{dg}(\mathrm{y})$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$
In other hand we have
$\operatorname{dg}(\mathrm{x} \alpha \mathrm{y})=\mathrm{d}(\mathrm{g}(\mathrm{x})) \alpha \mathrm{y}+\mathrm{g}(\mathrm{x}) \alpha \mathrm{d}(\mathrm{y})+\mathrm{d}(\mathrm{x}) \alpha \mathrm{g}(\mathrm{y})+\mathrm{x} \alpha \mathrm{d}(\mathrm{g}(\mathrm{y}))$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$
Comparing (25) and (26) we get
$\mathrm{g}(\mathrm{x}) \alpha \mathrm{d}(\mathrm{y})+\mathrm{d}(\mathrm{x}) \alpha \mathrm{g}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$.
By Lemma 2.4 we get $d$ and $g$ are orthogonal. Now replacing $x$ by $z \beta x$ in (24), we obtain
$\mathrm{G}(\mathrm{z}) \beta \mathrm{x} \alpha \mathrm{d}(\mathrm{y})+\mathrm{z} \beta \mathrm{g}(\mathrm{x}) \alpha \mathrm{d}(\mathrm{y})+\mathrm{D}(\mathrm{z}) \beta \mathrm{x} \alpha \mathrm{g}(\mathrm{y})+\mathrm{z} \beta \mathrm{d}(\mathrm{x}) \alpha \mathrm{g}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha$, $\beta \in \Gamma$.

Using (27), we get
$\mathrm{G}(\mathrm{z}) \beta \mathrm{x} \alpha \mathrm{d}(\mathrm{y})+\mathrm{D}(\mathrm{z}) \beta \mathrm{x} \alpha \mathrm{g}(\mathrm{y})$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.
Substituting $\mathrm{g}(\mathrm{r}) \gamma \mathrm{x}$ for x in (28), we obtain
$\mathrm{G}(\mathrm{z}) \beta \mathrm{g}(\mathrm{r}) \gamma \mathrm{x} \alpha \mathrm{d}(\mathrm{y})+\mathrm{D}(\mathrm{z}) \beta \mathrm{g}(\mathrm{r}) \gamma \mathrm{x} \alpha \mathrm{g}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z}, \mathrm{r} \in \mathrm{M}$ and $\alpha, \beta, \gamma \in \Gamma$.
By orthogonality $d$ and $g$ of $M$ we get
$\mathrm{D}(\mathrm{z}) \beta \mathrm{g}(\mathrm{r}) \gamma \mathrm{x} \alpha \mathrm{g}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z}, \mathrm{r} \in \mathrm{M}$ and $\alpha, \beta, \gamma \in \Gamma$.

In particular if $\mathrm{r}=\mathrm{y}$, and putting x by $\mathrm{x} \beta \mathrm{D}(\mathrm{z})$, we obtain
$\mathrm{D}(\mathrm{z}) \beta \mathrm{g}(\mathrm{y}) \gamma \mathrm{x} \beta \mathrm{D}(\mathrm{z}) \alpha \mathrm{g}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta, \gamma \in \Gamma$.
Using $\left(^{*}\right.$ ) and semiprimeness of M we obtain
$\mathrm{D}(\mathrm{z}) \beta \mathrm{g}(\mathrm{y})=0$,for all $\mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\beta \in \Gamma$.
Replacing y by yox in(29) and using (29), we get $\mathrm{D}(\mathrm{z}) \beta \operatorname{yog}(\mathrm{x})=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in$ $M$ and $\alpha, \beta \in \Gamma$

That is D and g are orthogonal.
Substituting (29) in (24) we get G and d are orthogonal.
Conversely (iii) $\rightarrow$ (i) since D and g are orthogonal, we get $\mathrm{D}(\mathrm{x}) \alpha \mathrm{m} \beta \mathrm{g}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y}, \mathrm{m} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$. By Lemma 2.3 we get
$D(x) \alpha g(y)=0$, for all $x, y \in M$ and $\alpha \in \Gamma$.
Since $G$ and $d$ are orthogonal, we get $G(x) \alpha m \beta d(y)=0$, for all $x, y \in M$ and $\alpha, \beta \in$ $\Gamma$. By Lemma 2.3 we get
$G(x) \alpha d(y)=0$, for all $x, y \in M$ and $\alpha \in \Gamma$.
Hence
$\mathrm{DG}(\mathrm{x} \alpha \mathrm{y})=\mathrm{D}(\mathrm{G}(\mathrm{x}) \alpha \mathrm{y}+\mathrm{x} \alpha \mathrm{g}(\mathrm{y}))$
$=\mathrm{D}(\mathrm{G}(\mathrm{x})) \alpha \mathrm{y}+\mathrm{G}(\mathrm{x}) \alpha \mathrm{d}(\mathrm{y})+\mathrm{D}(\mathrm{x}) \alpha \mathrm{g}(\mathrm{y})+\mathrm{x} \alpha \mathrm{d}(\mathrm{g}(\mathrm{y}))$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$.
Using (30) and (31) we get the result.
(ii) $\leftrightarrow$ (iii) proved by the similar way.

Proposition 3.6: Let $M$ be a 2-torsion free semiprime $\Gamma$-ring, and ( $D$, d) is a generalized derivation of $M$. If $D(x) \alpha D(y)=0$, for all $x, y \in M$ and $\alpha \in \Gamma$, then we have $\mathrm{D}=\mathrm{d}=0$.

Proof. By the hypothesis we have
$\mathrm{D}(\mathrm{x}) \alpha \mathrm{D}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha \in \Gamma$.
Replacing y by y $\mathrm{y} z$, we get
$0=\mathrm{D}(\mathrm{x}) \alpha(\mathrm{D}(\mathrm{y}) \beta \mathrm{z}+\mathrm{D}(\mathrm{x}) \alpha \mathrm{y} \beta \mathrm{d}(\mathrm{z})=\mathrm{D}(\mathrm{x}) \alpha \mathrm{y} \beta \mathrm{d}(\mathrm{z})$, for all $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$
By Lemma 2.3 we obtain
$\mathrm{d}(\mathrm{z}) \alpha \mathrm{D}(\mathrm{x})=0$, for all $\mathrm{x}, \mathrm{z} \in \mathrm{M}$ and $\alpha \in \Gamma$.
Replacing x by $\mathrm{x} \gamma \mathrm{z}$ in (33) and using (33), we obtain $0=\mathrm{d}(\mathrm{z}) \alpha \mathrm{D}(\mathrm{x}) \gamma \mathrm{z}+\mathrm{d}(\mathrm{z}) \alpha \mathrm{x} \gamma \mathrm{d}(\mathrm{z})=\mathrm{d}(\mathrm{z}) \alpha \mathrm{x} \gamma \mathrm{d}(\mathrm{z})$, for all $\mathrm{x}, \mathrm{z} \in \mathrm{M}$ and $\alpha, \gamma \in \Gamma$.

By semiprimeness we obtain $d(z)=0$, for all $z \in M$. Now replacing $x$ by $y \beta x$ in (32) and using (33), we get
$\mathrm{D}(\mathrm{y}) \beta \mathrm{x} \alpha \mathrm{D}(\mathrm{y})+\mathrm{y} \beta \mathrm{d}(\mathrm{x}) \alpha \mathrm{D}(\mathrm{y})=\mathrm{D}(\mathrm{y}) \beta \mathrm{x} \alpha \mathrm{D}(\mathrm{y})=0$, for all $\mathrm{x}, \mathrm{y} \in \mathrm{M}$ and $\alpha, \beta \in \Gamma$.

By semiprimeness we obtain $D(y)=0$, for all $y \in M$. That is $D=d=0$.
